

Instructions on installing a key garage door lock.

AGG DOORS pty ltd

1. Screw the garage door deadbolt linkage into both sides of the rail tracks on the side of the garage door.
2. Connect it at approximately 3 or 4 feet from the ground, making sure the deadbolt slides into a side rail slot to lock the door.
3. Connect the steel wires to each one of the deadbolt linkages on both sides of the garage door. The wires should reach the centre of the garage door.
4. Drill a hole in the centre of the garage door at the same height as you have mounted the side deadbolts.
5. Fit the handle through the hole in the centre of the garage door. Make sure the handle is on the outside of the garage door.
6. Screw the inside fastener onto the handle stem on the inside of the door.
7. Connect the deadbolt wire linkages to the door handle eyelets on the inside of the door
8. Turn the handle on the outside and make sure the steel wires pull the deadbolts out of the rail slots as well as checking that the key works and locks the deadbolts into their spots..
